This piece of Javascript will calculate the result of an election conducted using the single transferable vote. It is based on the [alternative vote calculator](#). The script uses the Weighted Inclusive Gregory Method for reallocating surplus votes. The quota for election is $(\text{number of votes})/(\text{number of seats} + 1)$ rounded up to two decimal places. At each stage of the count, if more than one candidate has surplus votes, the largest surplus will be transferred first. All ties are broken randomly.
